

Physical Attacks

CompTIA PenTest+ (PT0-003)

Domains:

- 2.0 Reconnaissance and Enumeration
- 3.0 Vulnerability Discovery and Analysis

Objectives:

- 2.1: Given a scenario, conduct a social engineering or physical attack
- 3.3: Explain physical security concepts

Video Overview

This video on physical attacks provides a comprehensive understanding of various methods attackers use to gain unauthorized access to systems and information. By exploring concepts like impersonation, tailgating, and the use of specialized tools, you'll gain insight into how these real-world scenarios unfold. This knowledge is directly applicable to your professional development in cybersecurity, enabling you to recognize vulnerabilities and implement effective security measures in various organizational settings.

Key Topics Covered

- Physical attacks: direct access to devices, systems, or facilities to steal information, install malware, or cause damage
- Impersonation: physically pretending to be someone else
- Tailgating and piggybacking: gaining unauthorized entry by following or interacting with an authorized individual
- Dumpster diving: searching through trash for sensitive information
- Shoulder surfing: observing sensitive information being entered
- Badge cloning: replicating RFID badge information using tools like Proxmark
- Site surveys: gathering information about a facility to plan an attack
- Lock picking: manipulating locks to open them without a key
- USB drops: leaving malicious USB drives for targets to interact with
- Prevention strategies: locks, authentication points, surveillance, access controls, secure disposal, and staff education
