

MAC Spoofing

CompTIA PenTest+ (PT0-003)

Domain: 4.0: Attacks and Exploits

Objectives:

- 4.1: Given a scenario, analyze output to prioritize and prepare attacks.
- 4.7: Given a scenario, perform wireless attacks using the appropriate tools.

Video Overview

This video provides an overview of MAC spoofing, a technique used in cybersecurity for various purposes, including penetration testing. You will learn what MAC spoofing is, why it is relevant, and how it can be applied in real-world scenarios, particularly in bypassing network access controls. Understanding these concepts will strengthen your knowledge for the PenTest+ certification exam and equip you with practical insights applicable to future cybersecurity careers.

Key Topics Covered

- MAC Spoofing: Impersonating another MAC address to gain unauthorized network access
- Immutability of MAC Addresses: MAC addresses are typically considered permanent, but can be changed with tools
- On-path Attacks: MAC spoofing used to intercept or alter network traffic
- MAC Filtering: How MAC spoofing bypasses network access controls
- Identifying Authorized Devices: Discovering MAC addresses of legitimate devices (e.g., printers, IP phones)
- Changing MAC Addresses: Process of taking wireless adapter out of monitoring mode and altering the hardware address
- Macchanger Tool: An alternative tool for changing or randomizing MAC addresses that can also remember the original MAC

Student Notes Section
